

**The reviewer's report on the paper 'Periodic solutions of the spatial extension of a conditionally periodic system' (revised version)
by Yu. D. Kozlov**

The paper was essentially improved. However, I think that the following issues should be addressed before the acceptance of the letter.

- The English should be improved. In particular, there are several comma mismatches, wrong use of articles and phrases too difficult to understand. In particular, on page 3, line 7, replace the words 'side by side' with the word 'along'.
- I suggest to slightly rearrange the paper. In particular, the Introduction contains the preliminary part starting at page 2, 3d line from bottom that I think can be an independent section.
- The dimensions in (0.2_μ) are unclear. What are ψ_j in the right-hand side of this formula?
- Am I right that 'e' stands for the exponent? I suggest to explain this. Now there is a slight confusion due to the use of symbol \hat{e} for the vector with unit entries.
